5 octobre 2022

# Blockchain

A data ledger made of a sequence of blocks maintained by a achieving consensus in a Peer-To-Peer network.

- Decentralized
- Public/private
- Permissionned/permissionless
- Immutable
- Incentive compatible

We will focus on public blockchain and their associated consensus protocol.

# Blocks

A block contains

- block height/ID
- Time stamp
- hash of the block
- hash of the previous block
- Set of transactions (data stored in the blockchain)

```
Block Height: 0
Block Hash: a52bea61a9f4131588cc101e8e1c731fa9f69f16934c5ab3a05a2134a42c13e0
Time:2021-07-12 10:03:04.812744
Block data: [{"sender": "Coinbase", "recipient": "Satoshi", "amount": 100, "fee": 1}]
Mined: False
Previous block hash: 0
-----
```

<https://www.blockchain.com/>

# Consensus protocols

The mechanism to make all the nodes agree on a common data history.

The three dimensions of blockchain systems analysis

## 1 Efficiency (Queueing theory)

- Throughputs
- Transaction confirmation time

## 2 Decentralization (Entropy)

- Fair distribution of the accounting right

## 3 Security (Insurance Risk Theory)

- Resistance to attacks

X. Fu, H. Wang, and P. Shi, "A survey of blockchain consensus algorithms : mechanism, design and applications," *Science China Information Sciences*, vol. 64, nov 2020.

# Applications of blockchain : Cryptocurrency

S. Nakamoto, "Bitcoin : A peer-to-peer electronic cash system." Available at <https://bitcoin.org/bitcoin.pdf>, 2008.

- Transaction anonymity
- Banking and reliable currency in certain regions of the world
- Money Transfer worldwide (at low fare)
- No need for a trusted third party

# How does it work ?

- 1 No central authority (Decentralized network)
- 2 Ledger to record all the transactions and coin ownership (blockchain)
- 3 A coin generation process (block finding reward)
  - Incentive to the full nodes
- 4 Ownership can be proved cryptographically (wallet associated to a public/private key)
- 5 Transactions can be issued by an entity proving ownership of the cryptographic unit (through the private key)
- 6 The system cannot process more than one transaction associated to the same cryptographic unit (double spending)

J. Lansky, "Possible state approaches to cryptocurrencies," *Journal of Systems Integration*, vol. 9, pp. 19–31, jan 2018.

# Cryptocurrency implementation

## Blockchain parameters

- Consensus protocol (PoW or PoS)
  - ↳ Hash function (SHA-256 for Bitcoin and scrypt for LiteCoin)
  - ↳ Hybrid PoW/PoS (PeerCoin)
- Block generation time
  - ↳ every 10 minutes for Bitcoin
  - ↳ every 12 sec for Ethereum
- Block finding reward
  - ↳ Halved every 210,000 blocks in Bitcoin. It started at 50 BTC, is now 6.25 BTC  
<https://www.bitcoinblockhalf.com/>
- Total coin supply
  - ↳ 21,000,000 in total for Bitcoin
- Transaction fees
  - ↳ GAS in Ethereum

These choices lead to the creation of multiple cryptocurrencies

### Examples

Bitcoin and AltCoins (Ethereum, LiteCoin, DogeCoin, Ripple... ), see [https://en.wikipedia.org/wiki/List\\_of\\_cryptocurrencies](https://en.wikipedia.org/wiki/List_of_cryptocurrencies)

# Decentralized application

The network provide ressources such as

- storage
- computing power

through a smart contract on the ethereum blockchain.

GOLEM (<https://www.golem.network/>)

Build a network of idle computers to do paralell computing.

Utility tokens are used to access the service and provision the network ressources.

Equation of Exchange (Fisher 1911)

$$MV = PQ$$

# Decentralized finance

DEFI creates new financial architecture

- + Non custodial
- + Anonymous
- + Permissionless
- + openly auditable
- Unregulated
- Tax evasion
- Fraud
- Money laundering

Extends the Bitcoin promises to more complex financial operations

- Collateralized lending
- Decentralized Exchange Platform
- Tokenized assets
- Fundraising vehicle (ICO, STO, ...)

S. M. Werner, D. Perez, L. Gudgeon, A. Klages-Mundt, D. Harz, and W. J. Knottenbelt, "Sok : Decentralized finance (defi)," 2021.

# Tokenized real-world assets

Tokenized version of a real-world, physical asset

- Increases the liquidity of certain type of assets
- Make certain classes of assets available to the many
- Can be used as store of value or collateral

These token can be backed by

- fiat currency ⇒ stablecoin
- commodities like gold <https://ekon.gold/>
- stocks (security token) that includes voting right and profit sharing mechanism
- Art
- Digital art (Non Fungible tokens on the Ethereum blockchain)

## Central authority

This requires a custodian to ensure that the tokens are actually backed by these off-chain assets (except for NFTs).

OECD, "The tokenisation of assets and potential implications for financial markets," tech. rep., 2020.

# Valuation models

- Cryptocurrencies are medium of exchange and may be priced via transaction cost model (Beaumol-Tobin and such)
  - ❑ W. J. Baumol, "The transactions demand for cash : An inventory theoretic approach," *The Quarterly Journal of Economics*, vol. 66, p. 545, nov 1952.
  - ❑ L. Schilling and H. Uhlig, "Some simple bitcoin economics," *Journal of Monetary Economics*, vol. 106, pp. 16–26, oct 2019.
- Tokenized asset depends on the real asset that backs the token
  - ❑ J. Hargrave, N. Sahdev, and O. Feldmeier, "How value is created in tokenized assets," in *Blockchain Economics : Implications of Distributed Ledgers*, pp. 125–143, WORLD SCIENTIFIC (EUROPE), jan 2019.
- Utility tokens
  - ❑ J. R. Gan, G. Tsoukalas, and S. Netessine, "Initial coin offerings, speculation, and asset tokenization," *Management Science*, vol. 67, pp. 914–931, feb 2021.
  - ❑ L. W. Cong, Y. Li, and N. Wang, "Tokenomics : Dynamic adoption and valuation," *The Review of Financial Studies*, vol. 34, pp. 1105–1155, aug 2020.

# ICO tuning and timeline

## 1 ICO period

- The firm publishes a white paper and set
  - The token price  $\tau$
  - The total number of token  $m$
  - The number of token issued to the investors during the ICO  $n \leq m$ .
- $s$  among  $z >> m$  investors buy token

## 2 Production period

- The firm uses the funds raised  $s\tau$  to finance the production of  $Q$  units of goods

## 3 Market period

- Customers purchase token to meet their needs  $D \sim F(\cdot)$

J. R. Gan, G. Tsoukalas, and S. Netessine, "Initial coin offerings, speculation, and asset tokenization," *Management Science*, vol. 67, pp. 914–931, feb 2021.

# Insights

## Optimal number of tokens sold $n^*$

The more token the firm sells during the ICO

- The more money to invest in production
- The less tokens it has to sell in the secondary market
- The less "skin in the game"
- The less it wants to invest in production ex post

$n^*$  resolves the trade off between money now and money later while controlling moral hazard.

## Optimal token price $\tau^*$

- Price too low : Not enough funds raised
- Price too high : not enough upside for investors

Gerry Tsoukalas talk at

[https://www.youtube.com/watch?v=E\\_NT4t4ws8U](https://www.youtube.com/watch?v=E_NT4t4ws8U)

# Decentralized insurance

## Parametric insurance

Compensation if a measurable quantity reaches a threshold

- Example : Flight delay insurance
  - [https://etherscan.io/address/  
0xdc3d8fc2c41781b0259175bdc19516f7da11cba7](https://etherscan.io/address/0xdc3d8fc2c41781b0259175bdc19516f7da11cba7)
- Use smart contract and off-chain data through oracles
- Transparent and automatic

# Blockchain as a research topic

- Computer science
  - Peer-to-peer networks and consensus algorithm
  - Cryptography and security
- Economics
  - Game theory to study the incentive mechanism at play
  - Nature of the cryptoassets
- Operations research
  - Optimization of complex system
- Financial math
  - Valuation models for cryptoassets
- Machine learning and statistics
  - Open data
  - Interaction between blockchain users
  - (Social) network analysis
  - Clustering of public keys and addresses in the bitcoin blockchain.
